A high-accuracy people counting solution that:

- is based on 3D MLI Sensor™ technology
- runs on embedded software
- performs bi-directional counting
- offers an accuracy of > 99%
- has configurable data storage
Being able to accurately track and record the precise number of people present in building or moving through high-traffic areas at any given time is an invaluable asset. An exact count not only allows organizations to optimize their staffing and energy demands, it is also a key component in marketing intelligence gathering initiatives.

The People Counter offers the following functions:

- Occupancy Monitoring in real time to:
  - control minimum and maximum occupancy
  - support evacuation measures
- Detection and analysis of pedestrian flows. With the web-based Occupancy Monitoring software, the count data that has been collected can be displayed in real time (live GUI). The software also has the capacity to provide historical data analysis, data aggregation and time plotting – allowing organizations to calculate such things as the maximum number of people, and the average time an individual spends in a particular area
- Optimization of a building’s ventilation and energy efficiency
- Wrong way detection – detecting and counting people moving in the wrong direction

**3D MLI Sensor™ Technology**

IEE has developed a 3D sensor that uses MLI (Modulated Light Intensity) technology. This technology is based on the optical time of flight (TOF) principle, where an active, non-scanning light source emits modulated near-infrared light. The phase shift between the light emitted by the source and the light reflected by the people and objects in the field of view is measured to create a real-time topographic image of the monitored area. The overhead-located 3D MLI Sensor™ processes 3D data in order to detect and count the number of people in a specific area and track the direction of their movements.

**Unparalleled Accuracy >99%**

Extensive test scenarios have demonstrated that the People Counter’s sophisticated algorithms ensure reliable segmentation, tracking and counting of people.

With an accuracy of greater than 99% in the field, the People Counter provides more reliable data than the passive infrared sensors, laser scanners or 2D video-based systems currently on the market.
Advantages

Easy Installation and Integration

The People Counter’s Design Housing provides easy and aesthetic integration into existing building architecture. The Design Housing can be integrated into dropped ceilings ("flush mount"), on the ceiling ("on-ceiling") or, by using an extension, below the ceiling ("under-ceiling") offering increased flexibility for all kinds of ceiling structures. After a basic configuration, such as detection area and mounting height, has been carried out, the sensor calibrates itself within a few seconds.

Reliability in Changing Light Conditions

Since the sensor emits its own illumination, the performance is not influenced by artificial light and the sensor also works in the dark.

Embedded Software

Due to its integrated people-counting firmware, the sensor does not require any additional computers or servers to process the data it captures. Its ‘chip on board’ function means that the sensor is capable of outputting count data or generating alarms.

Self-Diagnostics

A self-diagnostic routine runs at start-up and is regularly repeated to detect any sensor malfunction.

Integrated Audible Alarm

An integrated alarm signal can provide an acoustic confirmation of a people count. The integrated alarm can also sound when an occupancy threshold for single-door areas has been met or if a sensor malfunction has been detected.

Doors and Staircases

Doors swinging through the detection area pose no problem for the People Counter. The sensor also functions in stairwells.
One Device, Multiple Applications

Demand Controlled Ventilation (DCV)

DCV is a ventilation control strategy that provides the right amount of fresh air needed by the occupants in a specified area. It ensures that areas such as seminar rooms, offices, and museums are ventilated in an optimal and energy-efficient manner. After calculating the number of occupants, the People Counter provides this information to the DCV unit, allowing the ventilation to be instantly adapted based on the fluctuating demand. This helps to optimize the indoor air quality and save energy.

Marketing Intelligence for Retail Environments

A key indicator of a store’s performance is its conversion rate or the percentage of visitors who actually make a purchase. Marketing metrics such as CPM (cost per thousand) and SSF (shoppers per square foot) can only be generated if accurate statistics on visitor numbers are available. By tracking visitor traffic and density, the People Counter helps store managers to analyze sales data to better plan staffing levels.

Occupancy Monitoring

Minimum and Maximum Occupancy Monitoring for Enhanced Building Safety

Safety-critical building complexes, high security areas, or retail stores, where there is usually a high pedestrian volume, are often subject to maximum occupancy regulations. Installed above each access point, the People Counter performs a bi-directional count of all people entering or exiting. By comparing all entries and exits in real time, the occupancy of a room, a particular floor, or an entire building can be determined. In the event of a building evacuation, valuable information about the exact number of people in the building at that time can be made available to emergency services.

A separate Occupancy Monitoring software allows the data management of up to 30 groups of 30 sensors, both for real-time analysis and for statistical analysis.

Similarly, in areas that require a minimum occupancy, such as laboratories or surveillance and control rooms, the People Counter monitors the occupancy level and issues an alert when the occupancy is too low.

Minimum Occupancy Monitoring in laboratories

Maximum Occupancy Monitoring in night clubs

Occupancy Monitoring for DCV

Retail Occupancy Monitoring
Wrong Way Detection

The People Counter detects people moving against the flow of traffic in the pre-defined wrong way and triggers an alarm to indicate a potential security risk. This type of monitoring typically takes place at arrival gates in airport, or at turnstiles in subways or train stations.

Wait Time Determination and Queue Management

If installed at multiple locations overlooking queues at airport check-in desks or security lanes, the People Counter can be used to accurately monitor the number of people in a queue, as well as the length of time they are required to wait, providing valuable input for operational staff to manage service levels. Ultimately, it can lead to a reduction in wait time, ensures overall better service to passengers, and prevents handling agents from having to pay quality infringement fees to the airlines.

Dwell Measurement and Loitering Detection

The People Counter not only accurately recognizes people standing close to each other in the detection area as individuals; it can also track them – even if they are barely moving or standing still. The sensor counts each person and provides a histogram of dwell times: providing crucial statistical information for retailers. This type of application is typically used to determine how much time customers spend in front of sales displays in supermarkets.

If installed above the entrance to a secured area, the People Counter can detect people loitering outside entrances and can trigger a warning signal to security staff in the event of suspicious behavior i.e. when a predetermined loitering time is exceeded.

Web-based Occupancy Monitoring Tool

The People Counter’s Occupancy Monitoring Tool offers real-time monitoring, extended data analysis, and recording and reporting functionalities, such as:

- Real-time monitoring of multiple zones and/or multiple doors
- The option to set thresholds in each occupancy zone to trigger an alarm, send e-mails or SMSes, or switch relays.
- Statistics such as average length of stay, average occupancy and total entries and exits
- Data plotting, including occupancy and entrances and exits, on user-definable graphs
- The ability to define report templates to streamline future analysis or to generate periodic customizable PDF reports that can be sent automatically by e-mail
- A web-based interface and a MySQL database

Wrong Way Detection

The People Counter detects people moving against the flow of traffic in the pre-defined wrong way and triggers an alarm to indicate a potential security risk. This type of monitoring typically takes place at arrival gates in airport, or at turnstiles in subways or train stations.

Network Protocols

- IP address, fixed or DHCP
- Application output: web interface HTTP or XML-RPC (optional)
- Time synchronization via SNTP
- Firmware updates via Ethernet

Logging

- Access to current status and counting history
- Configurable counting logging interval, e.g. 10 s -> Minimum log history 2 days 9 hours

Application Outputs

The following data is available via the web interface:
- total forward and backward count
- occupancy (number of people in a zone)
- occupancy low/high alarm (when the configurable threshold is met)
- current in (number of people present in the detection zone at any time)
- current in low/high alarm (if the configurable threshold is met)
- wrong way detection

Optional Relay Modules

The People Counter offers two types of relay or interface modules that:
- connect directly to the sensors via the data cable and switch if the following events take place: the occupancy threshold is exceeded, detection of movement in the wrong direction, the threshold is exceeded in either the forward or reverse direction, the current in (number of people currently in the field of view) threshold is exceeded
- connect to the computer running the Occupancy Monitoring Tool via USB and switch when the occupancy thresholds are met

Sensor Management Tool

The computer-based, multi-lingual sensor management tool enables the management of multiple sensors and offers the following features:
- Sensor configuration and backup
- Fast software updates via the Ethernet network
- Copy a given configuration to multiple sensors

Languages

Language packs can be uploaded into the sensors and can be changed at any time in the Sensor Management Tool.

Potential Application Areas

- Airports
- Banks
- Entertainment venues
- Laboratories
- Military and police infrastructure
- Movie theatres
- Museums
- Night clubs
- Offices
- Public transportation facilities
- Retail environments, malls and shops
- Seminar rooms
- University campuses
